Lipotripsy

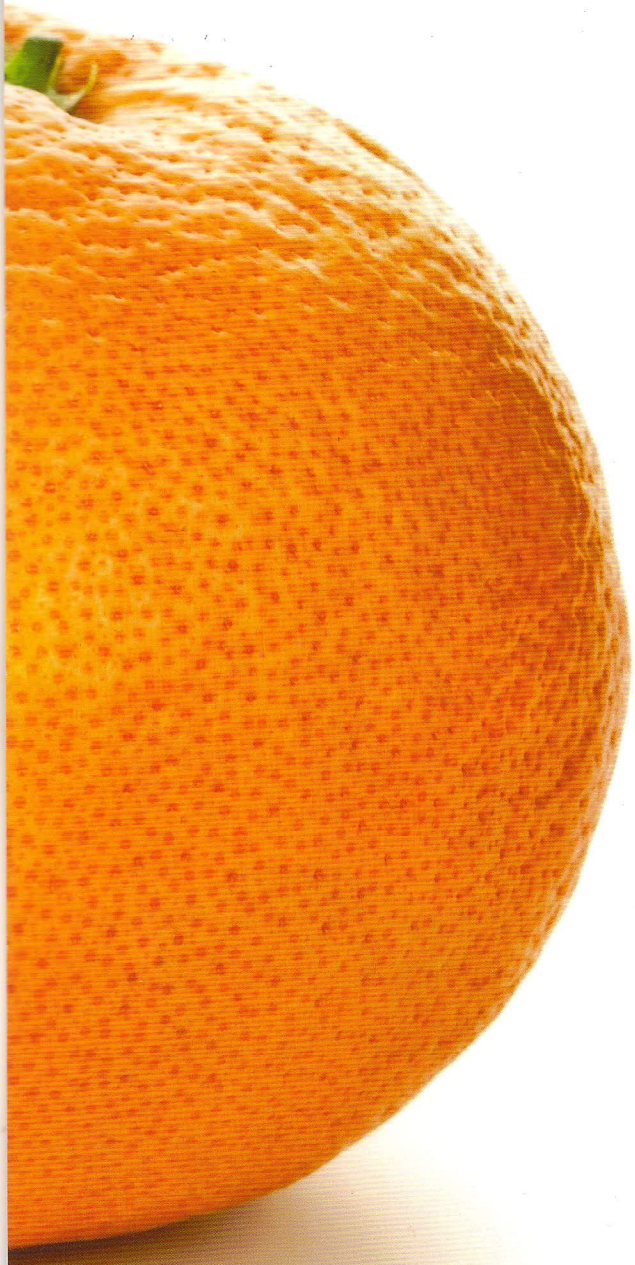
Redefine Yourself

A non invasive treatment for:

Cellulite and Body Shaping

Radial Wave Therapy

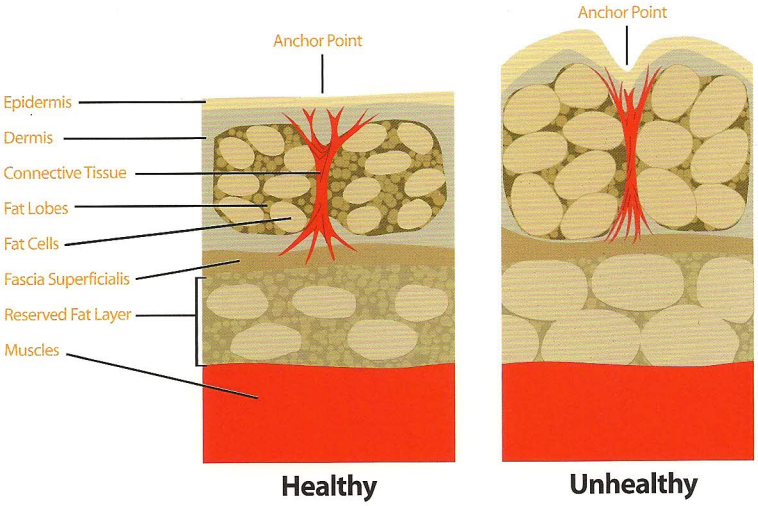
Non Invasive | Clinically proven | High client satisfaction



The Problem

Cellulite is a term used to describe the dimpled and often nodular appearance of skin within 85% of post pubescent females, due to the herniation of the subcutaneous fat within the fibrous connective tissue. This topographic skin change is also due to an imbalance between lipogenesis (fat production) and lipolysis (fat release), leading to the formation of large compact fat cells. Cellulite often appears to varying degrees in the pelvic regions, lower limbs and abdomen.

The formation of Cellulite



There are numerous invasive and non invasive therapies that purport to reduce cellulite, but few, if any are supported in the scientific or medical literature.

Clients have expectations for a safe, clinically proven non invasive treatment that provides achievable long lasting results.

The Solution

Lipotripsy is a non invasive treatment utilising Radial Wave Therapy. Lipotripsy is the next generation non invasive treatment to stimulate fat breakdown, collagen synthesis and facilitate lymphatic drainage. Radial Wave Therapy is applied to specific areas of the body triggering the fat cells to become permeable, leading to the intracellular passage of lipids into the lymphatic system. Lipotripsy enhances neo-vascularisation restoring blood circulation to the skin, leading to an increase in oxygen levels and skin elasticity.

Following a course of between 8 to 10 sessions, Lipotripsy through Collagen Synthesis and cellular permeability leads to a reduction in lipid density and provides lasting results to the skin. In many cases inch loss and circumference reduction are observed following a course of Lipotripsy with the Swiss DolorClast.

Mrs Ramsay from Macclesfield
"I dropped a dress size in 4 weeks following a course of Radial Wave Therapy."

Lipotripsy FAQ:

1. Is Lipotripsy right for me?

While Lipotripsy is no substitute for exercise and a healthy diet, it can help if you have stubborn pockets of cellulite that refuse to go away.

2. Will Lipotripsy help me lose weight?

Lipotripsy is not a procedure specifically suitable for losing weight. However, as a body-sculpting technique it is highly effective. There are many reported examples where patients have received Lipotripsy and have seen circumference reduction in the areas treated coupled with overall weight loss. More research will be carried out to explore this further.

As such, Lipotripsy is not suitable for the treatment of clinically obese patients however it can be useful for anyone looking to kickstart a body contouring programme.

3. What areas can be improved by Lipotripsy?

Lipotripsy can be performed on many areas of the body including the outer and inner thighs, knees, hips, stomach, buttocks, waist and back.

4. What results can I expect from Lipotripsy?

The full impact of your Lipotripsy treatment may not be immediately noticeable, however following your first 3-4 treatment sessions you should be able to start seeing a change in the texture of your skin. The full visual benefit from the treatment should occur within one month and with the option of a maintenance program the results should be long lasting.

5. Can I combine Lipotripsy with other treatments?

Many people who undergo Lipotripsy choose to combine it with other procedures. We would advise that you speak with one of our therapists prior to the commencement of Lipotripsy to discuss your previous treatments and also your therapy goal.

6. How much does a course of Lipotripsy cost?

Our experienced therapists would be able to advise on how many treatment sessions you would require during your preliminary consultation.

Trying to redefine yourself?

Look no further - Lipotripsy is a clinically proven therapy to redefine and help contour your body.

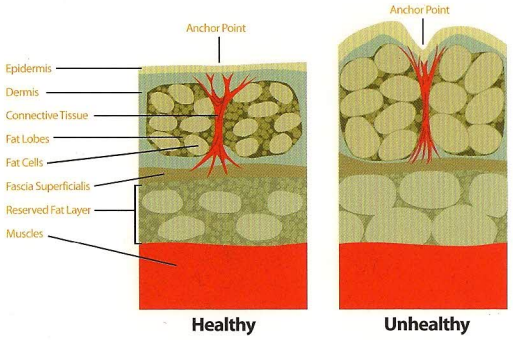
Shown to reduce the effects of celluite and reduce circumference around legs, waist and arms, Lipotripsy is a simple and safe treatment to achieve your goals.

Cellulite appearance:

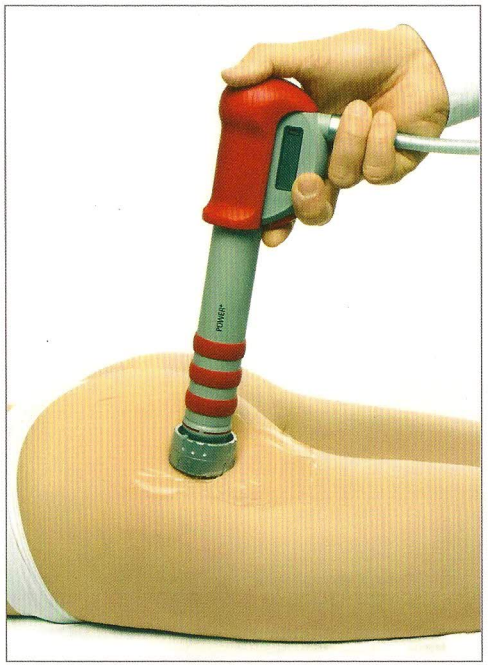
Trying to budge stubborn cellulite? A course of Lipotripsy can greatly reduce the appearance of cellulite. Healthy skin requires good blood flow with consistent levels of fat.

Lipotripsy will provide improvement of blood flow to the skin and reduce the volume of fat by helping your cells flush away unwanted fatty acids.

The formation of Cellulite



Lipotripsy



Lipotripsy explained:

Lipotripsy works by stimulating the fat break down, collagen synthesis and lymphatic drainage. Lipotripsy is delivered by placing a probe up against the areas of cellulite, as it passes over the area it emits Radial Waves through the skin.

Results

A course of treatment is typically 8-10 individual 45 minute sessions and results are seen as quickly as 2 weeks after starting the course. If you exercise and increase how much water you drink you may see even better results. 90% of women who took part in a clinical study would recommend this treatment (ref 1). Our experienced therapists will be able to tailor an individual Lipotripsy treatment plan to meet your desired goal.

Safety of treatment:

With any beauty therapies there are considerations to ensure the treatment is suitable for you The risks with Lipotripsy are low when used correctly, however if any of the following apply, you may not be eligible for the treatment and you must notify your therapist prior to receiving Lipotripsy:

- Pregnancy
- Breast Feeding
- If you take anti-coagulants such as warfarin
- If you have a pace maker
- If you have any tumours within the region of treatment
- Infections
